MARKET INTELLIGENCE

Which offshore companies combine scale and profitability?

A financial clustering analysis of selected subsea and offshore companies.

23	2	US$ 203B
companies analysed	strategic clusters	combined sample revenue

Bruno van Ham Colchete

Subsea, Offshore and Market Intelligence

THE BUSINESS QUESTION

The offshore market is not one homogeneous competitive group

Scale, profitability and business model create materially different strategic positions.

01

Scale

How large is each company based on reported total-company revenue?

02

Profitability

Which businesses convert their scale into stronger EBITDA margins?

03

Peer groups

Which companies have genuinely similar financial profiles?

04

Benchmarking

Who combines relative size and profitability within the selected sample?

METHODOLOGY

From public financial information to strategic market clusters

1. **Collect**
   Revenue, EBITDA, market value, currency and company metadata.

2. **Standardise**
   Clean missing values and convert reported financial data into USD.

3. **Transform**
   Apply logarithmic revenue and standardise modelling variables.

4. **Cluster**
   Test K-Means models and compare them using silhouette score.

5. **Benchmark**
   Calculate percentiles, rankings, peer comparisons and outlier flags.

Important limitation

The current model uses total-company financial data. Subsea-only revenue requires manual annual-report validation.

STRATEGIC MARKET MAP

Scale alone does not explain profitability

The cluster model reveals companies with materially different economic profiles.

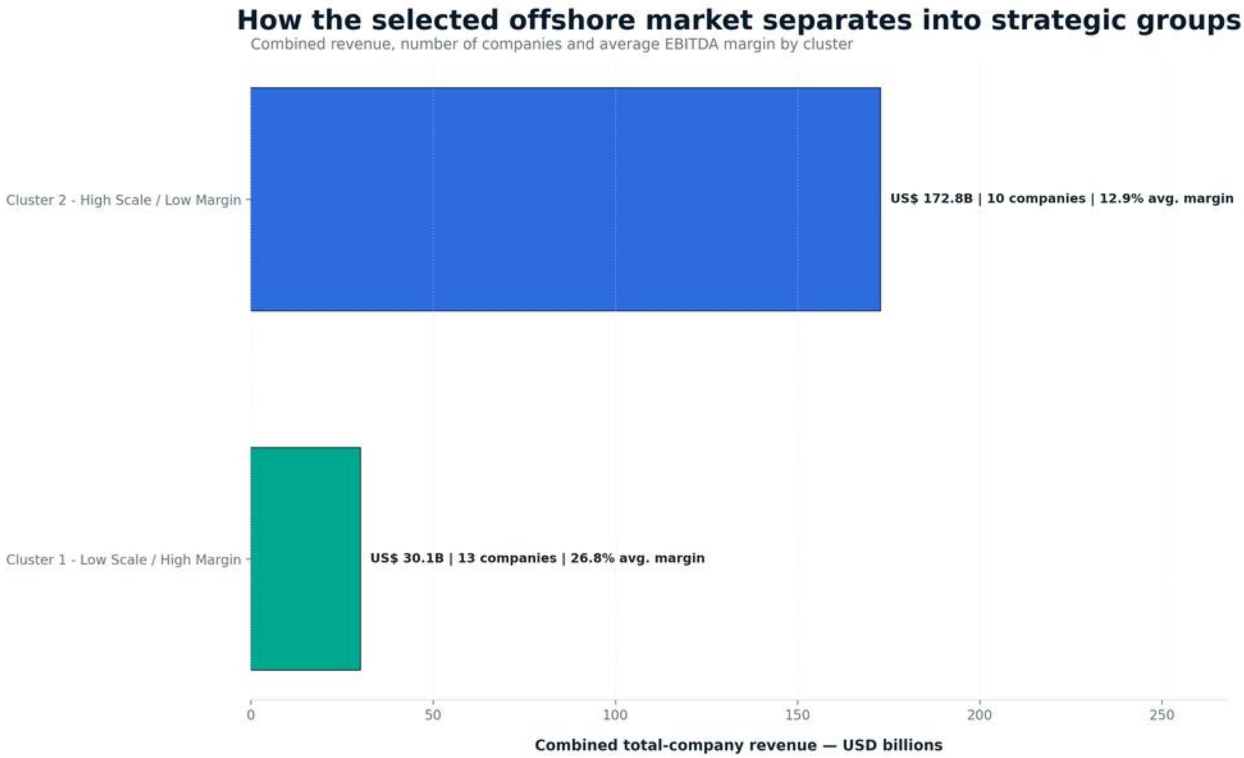
Which offshore companies combine scale and profitability?

23 companies | 2 strategic clusters | Bubble size reflects market value or revenue

Source: public financial data collected through the project workflow. Total-company figures; not validated subsea-only revenue.

STRATEGIC GROUPS

The selected market separates into distinct economic models



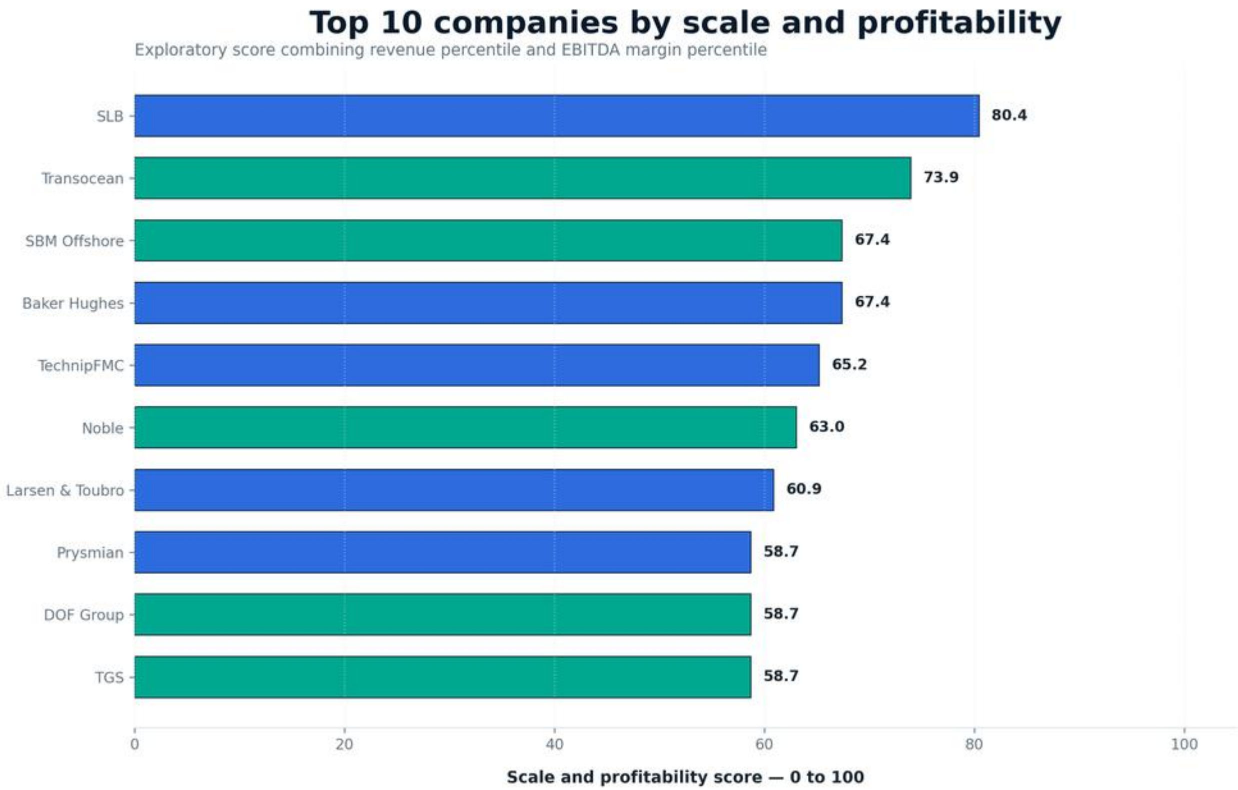
Largest cluster by combined revenue

Cluster 2 - High Scale / Low Margin represents US$ 172.8B across 10 companies.

BENCHMARKING

Who combines relative scale and profitability?

The score is a sample-based comparison, not an investment recommendation.



The benchmark is relative to the selected company sample and is not an investment recommendation.

Benchmark leader: SLB (80.4/100)

KEY FINDINGS

Three conclusions from the selected company sample

01

Revenue leader

SLB leads the sample with US$ 35.9B in reported total-company revenue.

02

Margin leader

TGS records the highest calculated EBITDA margin at 47.4%.

03

Scale versus margin

The revenue-margin relationship is moderate negative (correlation -0.32). Greater scale does not automatically mean higher margins.

FULL PROJECT

From a financial dataset to a reproducible market intelligence project

The full repository includes the methodology, cleaned dataset, clustering model, static visuals and interactive dashboard.

- **Financial data collection and cleaning**
- **K-Means clustering and model selection**
- **Peer benchmarking and statistical analysis**
- **LinkedIn publication assets**
- **Interactive dashboard for GitHub Pages**

Repository link will be added after publishing on GitHub
